Green Dry Cleaning in the Big Apple

Conventional Dry Cleaning wreaks havoc on the environment. Perc, the cleaning agent, used by most dry cleaners is a suspected carcinogen which has been found to run off into drinking and ground water and remain on clothing long after it's been hung up in your closet. Next generation dry cleaners, however, are turning to solutions that are not only better for the health of humans and the planet but also deliver a better dry clean. Joining Josh to discuss these new developments is David Kistner, CEO of [Green Apple Cleaners](#), a company with bold plans for the New York City region.

Catch the segment this Wednesday, January 10th at 9 am EST on the Lime Channel on [Sirius Satellite Radio 114](#) and streaming live at [Lime.com](#) with encore airings throughout the week.
